

Storytelling Version

As an aspiring Data Scientist transitioning into AI Engineering, I realized something: interview preparation feels broken.

Most people memorize questions, but they rarely experience the pressure of a real technical interview.

So instead of just studying AI, I decided to build one.

I designed and engineered a real-time AI Voice Interview System that simulates a human technical interviewer for Data Science, SQL, Machine Learning, Analytics, and AI roles.

The system listens to your spoken responses, evaluates your answer, gives constructive feedback, scores performance, and asks adaptive follow-up technical questions — all in real time.

Under the hood, I combined FastAPI, WebSockets, speech recognition, conversational memory, prompt engineering, and AI response orchestration to create a natural interview experience.

One of the biggest engineering challenges was making the interaction feel human rather than robotic — handling speech-to-text, AI speaking, session memory, real-time feedback, and maintaining conversational flow.

Building this project taught me that transitioning from Data Science into AI Engineering isn't just about learning models — it's about designing intelligent systems that people can actually interact with."

Why this works:

- Shows **problem solving**
- Shows **initiative**
- Shows **engineering mindset**
- Shows **AI system design**
- Shows **real-world product thinking**
